Questionnaire and Codebook

Digital Payment Adoption Survey

Factors influencing the adoption of digital payment systems among university students: A comparative study of China and India

Kashish Singh, Independent Researcher | ORCID 0009-0003-4553-6458 | Data collected 28-30 September 2026 | Data licence: CC BY 4.0

Method	Anonymous online survey (Google Form), 21 questions
Responses	100 exported; 88 in the analysis sample (54 China, 32 India, 1 Indonesia, 1 country not stated)
Exclusions	5 incomplete responses and 7 straight-lined responses (same rating on all 16 rating items) were removed. No answers were edited or imputed.
Sampling	Convenience / snowball sample. Results show associations only and do not represent all students in China or India.
Privacy	No names or email addresses were collected. Exact submission times were removed from the public data file.

Item wording below uses the short labels coded in survey_data.csv.

Section A. About you (4 questions)

Code	Question	Response options
Age range	Age range	18-20 / 21-23 / 24 and above
Gender	Gender	Female / Male / Prefer not to say
Country	Country of study	Country (China and India were the target groups)
Field	Field of study	Free text; grouped afterwards for description only (Tech & Engineering, Business & Economics, Medical & Health, Science, Arts & Humanities, Other / unclear)

Section B. Digital payment use and attitudes (17 questions)

Rating items use a 5-point scale (1 = lowest agreement, 5 = highest agreement). Usage frequency is a single choice question.

Code	Item (short label)	Construct	Response
Q1	Saves time vs cash	Usefulness	1-5
Q2	Improves money management	Usefulness	1-5
Q3	More convenient	Usefulness	1-5
Q4	Easy to learn	Ease of use	1-5
Q5	Simple to navigate	Ease of use	1-5
Q6	Little effort per transaction	Ease of use	1-5
Freq	Usage frequency	Usage (not in any construct)	Never / Rarely / Monthly / Weekly / Daily
Q7	Trust payment platforms	Trust	1-5
Q8	Peers influence me	Social influence	1-5
Q9	Norm in my social circle	Social influence	1-5
Q10	Data is protected	Trust	1-5
Q11	Intend to continue using	Intention	1-5
Q12	Would recommend to others	Intention	1-5
Q13	Confident errors would be resolved	Trust	1-5

Code	Item (short label)	Construct	Response
Q14	Worry about losing money	Perceived risk	1-5
Q15	Worry about fraud	Perceived risk	1-5
Q16	Hesitate on large transactions	Perceived risk	1-5

Scoring (as used in the analysis)

Construct	Items used	Number of items	Cronbach alpha (n=88)
Usefulness	Q1-Q3	3	0.78
Ease of use	Q4-Q6	3	0.78
Trust	Q7, Q10, Q13	3	0.82
Social influence	Q8, Q9	2	0.76
Intention	Q11, Q12	2	0.81
Perceived risk	Q14-Q16 (higher = more concern)	3	0.84

Construct score = mean of its items (1-5). Perceived risk is not reverse-coded; for a single positive-direction index, reverse Q14-Q16 as 6 minus the score. Usage frequency is scored Never = 1, Rarely = 2, Monthly = 3, Weekly = 4, Daily = 5. Two-item scales (social influence, intention) give only a rough alpha.
